

Editor Performance Report

A Slack bot that ranks creative editors by performance, one message per account, every Monday. Editors are identified by the token in the ad name. Detail lives behind links into Ads Manager, not in the message.

1. Accounts and editors

Editor tokens: Suzaine, Klemen, Santiago, CB, Ilias. Matched case-insensitively in the ad name, bounded by a delimiter.

#	Account	Meta ad account ID	Target	Pipes project
1	Splash Foam	258610945617994	1.3x	admin.fourammedia.com/platforms
2	Splash Spotless	271012631870595	to confirm	admin.fourammedia.com/platforms
3	Denta Blast	3484659138445892	to confirm	admin.fourammedia.com/platforms
4	Splash Spray	1472869896844785	1.3x	admin.fourammedia.com/platforms
5	Barks No More EST	810292903775985	1.45x	admin.fourammedia.com/platforms
6	X-All Air Ionizer -EST	852183256500077	to confirm	admin.fourammedia.com/platforms
7	Pee Buster - EST	1078631533275563	1.4x	admin.fourammedia.com/platforms
8	X-ALL Toilet Cleaner	3747514945517577	1.4x	admin.fourammedia.com/platforms
9	X-ALL Washing Machine	1946131762522115	1.4x	admin.fourammedia.com/platforms
10	X-ALL MPC	514584538156509 + 2620458594817497	1.4x	admin.fourammedia.com/platforms

- Targets and the spend floor (default \$1,000) live in this table, not in code.
- X-ALL MPC spans two ad accounts: sum the raw numbers across both before calculating any ratio.
- Where the target says "to confirm", run the account but show no green checks and no winning-ad count, header reading "target not set". Never fall back to a default: a borrowed target produces checkmarks nobody agreed to.

2. Cadence and the two windows

One message per account, every Monday. No separate monthly report. Every number belongs to one of two windows:

- **This week:** previous Monday to Sunday. Spend, orders, both ROAS figures. What happened, no verdicts.
- **Trailing 30 days:** the 30 days ending that Sunday. Green checks, winning-ad counts, top creatives. Enough data to judge on, and unlike a calendar month it refreshes weekly and has no month-boundary problem.
- Accounts with no spend still get a message saying so, so a missing message always means a broken pull.

3. Data to pull

Every field at ad level, for both windows.

Field	Source	Level
Amount spent	Meta	Ad
Purchase conversion value	Meta	Ad
Revenue	Pipes	Ad
Orders	Pipes	Ad
Ad first delivery date	Meta	Ad

Spend always comes from Meta. Only the numerator changes:

- **Pipes ROAS = Pipes revenue / Meta spend**
- **Meta ROAS = Meta purchase conversion value / Meta spend**

Any ROAS shown is SUM(revenue) / SUM(spend) over the ads in scope, never an average of per-ad ROAS values.

4. The join between Meta and Pipes

Confirm this before scoping anything else. Editors are identified by ad name, so every figure is a sum over individual ads. If Pipes cannot attribute revenue to a specific Meta ad, nothing here works. Join on the Meta ad ID, or on the UTM content parameter if it carries the ad name consistently across all ten accounts. Report the share of Pipes revenue that failed to join: if it is not near zero, every ROAS shown is understated.

5. Logic, per account

- Sort editors by amount spent, descending, in both sections.
- Green check when an editor's pooled Pipes ROAS over the trailing 30 days beats that account's target. Pooled: their total Pipes revenue over their total Meta spend. Verdicts appear only in the 30-day section.
- A winning ad clears both the spend floor and the ROAS target over the trailing 30 days, whatever its launch date. An ad from March still performing counts: the leaderboard has to reconcile with where the money went.
- Split that count into new and holdover using first delivery date. New means first delivered inside the trailing 30 days. This separates an editor still producing from one living off one old winner.
- An ad qualifies in the first Monday report where it clears both thresholds, not the week it launched. Because the floor is measured across 30 days, an ad spending \$600 a week accumulates past \$1,000 and appears in its second week.
- Never rank or pool editors across accounts. Targets and margins differ, so a blended figure means nothing.

6. Links

Every bold name links into Ads Manager, at ad level so the breakdown is by creative, and each link uses the window of the number it sits next to. Account total and the unassigned line open that account for that period; editor names add the ad-name-contains filter for their token. Build each filter once by hand in the UI, copy the URL, then template the account ID, token and dates: a URL that silently drops the filter looks identical until clicked.

7. What the message looks like

Splash Foam · Editor performance

Week of Mon 10 Aug to Sun 16 Aug 2026 · Target 1.3x · Floor \$1,000

💰 **Account total** · \$20,830 · 676 orders · Pipes **1.55x** · Meta 2.30x
❓ **No editor name** · 7 ads · \$2,410 · **12%** of account spend

This week

Santiago · \$7,340 · 297 orders · Pipes 1.94x · Meta 2.81x
Suzaine · \$5,110 · 182 orders · Pipes 1.71x · Meta 2.49x
CB · \$3,880 · 91 orders · Pipes 1.12x · Meta 1.93x
Ilias · \$2,090 · 41 orders · Pipes 0.94x · Meta 1.62x
Klemen · no spend this week

Trailing 30 days · 18 Jul to 16 Aug

✅ **Santiago** · \$28,900 · Pipes **1.88x** · **5 winning ads (2 new)**
1. SF_Santiago_FoamDemo_UGC_v4 · \$9,140 · 2.28x
2. SF_Santiago_BeforeAfter_Static_v2 · \$6,720 · 1.86x
3. SF_Santiago_SinkClog_Hook3 · \$4,410 · 1.54x · new
✅ **Suzaine** · \$20,400 · Pipes **1.66x** · **3 winning ads (0 new)**
1. SF_Suzaine_ScrubTest_v3 · \$7,880 · 1.95x
2. SF_Suzaine_MorningRoutine_UGC · \$5,240 · 1.72x
3. SF_Suzaine_SplitScreen_v2 · \$2,110 · 1.44x
▼ **CB** · \$16,100 · Pipes **1.21x** · **1 winning ad (1 new)**
1. SF_CB_KitchenGrease_v6 · \$3,980 · 1.41x · new
only 1 ad above target in 30 days
▼ **Ilias** · \$8,600 · Pipes **1.01x** · no ads cleared target

The header target and floor define a winning creative: for Splash Foam, an ad that spent over \$1,000 and cleared 1.3x across the trailing 30 days. Green above target, red below, and only in the 30-day section, because one week is not a verdict.

8. Build notes

- "CB" is two characters and will false-positive inside other words. Require a delimiter around it, never a raw substring match.
- Ads matching two tokens count for neither. Add them to the unassigned line rather than double-counting.
- The unassigned percentage is the health check on the report itself. When it climbs, the naming convention has slipped. Make the bot shout above 20%.
- An editor with fewer than three winning ads shows what there is and says so. Nothing is padded with ads that missed target.
- Timezone follows each ad account's reporting timezone, not server time. Run Monday afternoon so Pipes revenue has settled, and print the pull timestamp.
- One caveat when reading it: this measures ads carrying an editor's name, not editor skill in isolation. Brief, offer, audience and budget are all confounded with who cut the ad.
